Dear Sir,

We are currently working on a CS5013 project and looking for a stakeholder who has a specific workflow or data problem our team can solve. I would love it if you would consider acting as the stakeholder for our project.

As part of the course, we need to build a custom software tool in Java to streamline a real-world process. If you are open to collaborating, could you please reply to this email with a brief description of a problem you currently face?

Specifically, a short 3–4 sentence problem statement covering:

- **What the problem is:** (e.g., a manual data entry task, a repetitive administrative workflow, or a missing software tool in your lab/department).
- **The current pain point:** (e.g., how much time it takes currently, limitations of the current spreadsheets/tools you are using, etc.).

Our project proposal is due this Friday, August 21. Because the course requires us to attach your email reply as our official stakeholder acknowledgment, a brief response with your problem statement at your earliest convenience would be incredibly helpful.

For your reference we have attached the proposal template.

Thank you so much for your time and consideration.

Best regards,

S Naveen

Hi,

We discussed the problem statement yesterday- can you write down the points I mentioned and I can take a look if you have written what we discussed.

Dear Sir,

Thank you for getting back to us . As we discussed yesterday, we have drafted the points regarding the BibTeX mapping issue into a formal problem statement. Problem Statement: Researchers frequently handle multiple academic papers, each containing its own set of BibTeX references. The current problem point is the manual effort required to deduplicate and manage these references when combining files, as the same cited paper might be formatted or labeled differently across multiple sources. The proposed software will import these papers, automatically parse and map identical bibliography mentions to a single unique entry, and seamlessly merge the references. Furthermore, when new papers are imported, the system will identify existing references and map them to the established unique entries to prevent duplication. Please let me know if this accurately captures what we discussed, or if you would like me to adjust any details.

Best regards,
